In the context of medication safety, high-risk situations relate to those circumstances associated with a significant risk of medication-related harm, such as situations arising from look-alike, sound-alike (LASA) medications and high-alert medications. High-risk situations could be triggered by one or more of the following broad factors: medication, provider and patient, and systems factors (work environment).

Organizations need to prospectively design and implement strategies to identify high-risk situations related to medications and build a robust system that intercepts them before they result in patient harm.

At this webinar, we will introduce the WHO technical report on “Medication Safety in High-risk Situations” and experiences from different countries and organizations will be shared on how to address high-risk situations and reduce the risk of medication-related harm.

The session will be available in English, French and Spanish.
